# Up and Running with Python

### What we will cover...

- 1. What is Python?
- 2. Running Python.
- 3. Writing Python.

## What is Python?

Python refers to both:

- 1. A program (it runs on a computer).
- 2. A programming language.

The program's purpose is to **interpret** the language and convert it into instructions for a computer.

Python does not have a GUI, so we run it from a terminal.

Let's make sure we can find the program (the "executable").

which is a program, available in your terminal, that tells you where on your computer a given executable lives.

#### Let's run python:

```
> python3
Python 3.8.2 (default, Feb 26 2020, 22:21:03)
[GCC 9.2.1 20200130] on linux
Type "help", "copyright", "credits" or "license" for more information.

You can quite this "interactive interpreter" with ctrl+d.

## Writing Python

Python is a programming language.

It's named after Monty Python and was created by Guido van Rossum in 1991.

There are two major versions that are still circulating: 2 & 3.

Python2 has been dying a long, slow death for many years now. We will be using Python3 for this course.

## A python file

Open your text editor (ie VSCode) and open a new folder for this class.

Create a new file inside that folder and call it hello.py.

Write the following in the file (within your text editor):

```
message = 'Hello CodeOp!'
print(message)
```

# A python file

In your terminal:

- 1. Navigate to the directory of the hello.py file you just created. (remember: ls, pwd, cd).
- 2. Run the file with python: python3 hello.py.
- 3. Celebrate.

## Installing Packages

To complete the assignments, it can be helpful to have some basic python packages (libraries) installed on your computer:

- 1. pylint
- 2. pytest
- 3. pytest-xdist

You can install python libraries ("globally") with the following command:
